The service that XM is providing is a lot like the "Weather Channel" is it not? A company based in Atlanta providing weather for the entire United States and even countries outside the U.S. Is there any basis for why "XM" based in D.C.; would be unable to provide the same accurate accounts of this type of information. Maybe we should dissolve the AP wire service and only rely on local accounts for information.

Question: have the national networks proved why they can report at "the local level" in current events, including weather and traffic? If so has the "XM" network not met the same requirements?
